

Robi var

no.	type	values	side effects
x	int	10	non
'x'	char	some ASCII number between 'a' to 'z'.	non
x+1	int	11	will create R-value in register.
xxx x++	int	x = 10 + 1	1. read x val (10) 2. do 10 + 1 (11) 3. assigne 11 to x.
++x	int	x = 10 + 1	calc 10 + 1 assignite write to x.

no.	type	if value?
* Foo()	size_t	yes.
& Foo()	size_t**	no
foo()	int* size_t	no
foo	size_t*	yes
& Foo	size_t**	no

3. weak symbol is global variable that don't init or ~~global function~~ global function that don't have implementation.
and when linker see it this may happen:

a. ~~the~~ weak v.p weak symbol? will random code one of them and will ignore the other.

6. weak vs strong symbols: will take the strong symbol and ignore the weak,

4. will create the function stack, that will have:

reg, store save (~~key~~), variables that function get, sp of caller function, heap, port, to, w.
